Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims

1-9. (Canceled)

10. (Currently Amended) The lighting system according to claim 16 ~~[[1]]~~, wherein the light control unit instructs the lighting device to perform basic lighting when the verification subject information matches the verification reference information and instructs the lighting device to perform lighting that differs from the basic lighting when the verification subject information does not match the verification reference information.

11-15. (Canceled)

16. (Previously Presented) A lighting system comprising:

a lighting device;

an electronic key including a signal output unit, wherein the signal output unit generates and transmits a transmission signal containing verification subject information;

a light control unit connected to the lighting device, wherein the light control unit receives the transmission signal from the electronic key through wireless communication and verifies the verification subject information with verification reference information, the light control unit controlling activation and deactivation of the lighting device; and

a lock control unit for receiving the transmission signal through wireless communication and verifying the verification subject information with the verification reference information to control locking and unlocking of a house door and a vehicle door in accordance with the verification, the lock control unit including a first lock control unit arranged near the house door to control locking and unlocking of the house door and a second lock control unit arranged in the vehicle to control locking and unlocking of the vehicle door;

wherein the light control unit includes:

Appl. No. 10/648,467

Amdt.AF dated November 21

Reply to Final Office Action of September 26, 2005

a main controller located near the house door, the main controller having a first transmitting circuit for transmitting a request signal to the electronic key and a first receiving circuit for receiving the transmission signal from the electronic key; and

a transmitting-receiving circuit connected to the main controller and located near a parking of the vehicle, the transmitting-receiving circuit having a second transmitting circuit for transmitting a request signal to the electronic key and a second receiving circuit for receiving the transmission signal from the electronic key.

17. (Previously Presented) A lighting system comprising:

a lighting device;

an electronic key including a signal output unit, wherein the signal output unit generates and transmits a transmission signal containing verification subject information;

a light control unit connected to the lighting device, wherein the light control unit receives the transmission signal from the electronic key through wireless communication and verifies the verification subject information with verification reference information, the light control unit controlling activation and deactivation of the lighting device; and

a lock control unit for receiving the transmission signal through wireless communication and verifying the verification subject information with the verification reference information to control locking and unlocking of a house door and a vehicle door in accordance with the verification, the lock control unit including a first lock control unit arranged near the house door to control locking and unlocking of the house door and a second lock control unit arranged in the vehicle to control locking and unlocking of the vehicle door;

wherein the light control unit includes a receiving circuit located near a parking of the vehicle to receive the transmission signal from the electronic key, the light control unit being connected to the first lock control unit to receive the verification subject information from the receiving circuit and the first lock control unit.

18. (New) The lighting system according to claim 16, wherein the light control unit includes a selecting device for selecting one of an enablement mode, which enables the activation of the lighting device, and a disablement mode, which disables the activation of the lighting device, the light control unit activating the lighting device if the verification subject

information matches the verification reference information when the selecting device selects the enablement mode.

19. (New) The lighting system according to claim 17, wherein the light control unit instructs the lighting device to perform basic lighting when the verification subject information matches the verification reference information and instructs the lighting device to perform lighting that differs from the basic lighting when the verification subject information does not match the verification reference information.

20. (New) The lighting system according to claim 17, wherein the light control unit includes a selecting device for selecting one of an enablement mode, which enables the activation of the lighting device, and a disablement mode, which disables the activation of the lighting device, the light control unit activating the lighting device if the verification subject information matches the verification reference information when the selecting device selects the enablement mode.
